As of 04/04/09 we support UMTS 3G / 3.xG / 4G/ LTE and CDMA2000(EV-DO) modems connected via the USB port or as mPCIe cards.

## Supported Platforms

- ARM: Broadcom, Xscale, Storlink
- MIPS: Atheros 7xxx and 9xxx, Broadcom K26 and K3.x builds, Ralink
- Freescale P1
- X86
- X64 (x86\_64)

Direct ethernet protocol (currently only QMI) requires the router being able to run Linux 3.x and 8MB minimum flash memory. Routers with 4MB flash do only have support for the serial ppp dialup protocol. Support for other direct ethernet protocols may be included in the future for routers with at least 16MB flash.

## Non-Working Modems

Contact the developers via the community forum if your device is not working **AFTER** you have installed the **latest BETA build** and tested it. Give them the following info:

**usb vendor id, product id (vid:pid), and interface list** from the command line:

```
cat /sys/kernel/debug/usb/devices
```

## Supported Modems

This is **not** a complete list of supported devices, new modems are continuously being added. Your modem may still be working even if it is not listed here, install the **latest BETA build** and test it.

The mfgs model name is not a reliable way of identifying a modem, the same model name is often used on different markets but with a different modem internal firmware version.

The USB vendor and product id (vid:pid) are the main parameters to use when checking if a modem is supported or not supported.

WIP = Work In Progress
