How do I set up a canonical firewall with DD-WRT? In particular, let's say I want to block all incoming traffic from the internet except for traffic from domains \*.cooldomain.com and sshd traffic from \*.myhouse.com . With a normal linux box, you do this by adding a /etc/hosts.allow file which inetd reads and then rejects packets accordingly. Such a file might look like:

```
all : .cooldomain.com : allow
sshd : .myhouse.com : allow
ALL : ALL : deny
```

How do you do similar in DD-WRT? I think such information should go here. Thanks!
