

WDS - LAN / P2P / SUBNET - explanations required

The choice between WDS LAN, WDS P2P and WDS SUBNET remains confusing to a lot of us, non german readers, on the forum:

- which one to choose, for which purpose ?
- what can be done with WDS P2P which can not be done through WDS LAN ?
- same question about WDS subnet ?
- does DD-WRT enforce firewall and port forwarding rules between the several networks defined in WDS P2P ?

Here is an [interesting comment on WDS P2P](#). It is written in spanish, and likely does not cover the whole issue. See also this talk describing [a possible WDS P2P configuration](#). Perhaps some others relevant posts might be found on the forum.

If someone has the skill to edit the wiki page [WDS Point To Point \(P2P\)](#) to answer these questions, it would be more than appreciated. Unfortunately, I don't.
